DETAILED ACTION

Remarks

The allowability of claims 62 and 67 is withdrawn in view of the following rejections.

Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 62 and 67 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the enablement requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

The claims are to a method of treating an HIV infection by intravaginally administering an siRNA targeting CCR5. The claims encompass methods of treating any HIV infection. According to the specification, "treating" is defined as follows:

Art Unit: 1635

As used herein, "treatment," or "treating," is defined as the application or administration of a therapeutic agent (e.g., one or more RNA interfering agents, e.g., siRNAs) to a patient, or application or administration of a therapeutic agent to an isolated tissue or cell line from a patient with the purpose to cure, heal, alleviate, relieve, alter, remedy, ameliorate, improve or affect the infectious disease or disorder, symptoms of an infectious disease or disorder, or inoculate against an infectious agent which is capable of causing an infectious disease or disorder.

The specification describes the use of CCR5 siRNAs comprising SEQ ID NOs: 1 and 2 in cultured MDM cells, wherein the siRNAs were transfected into the cells (p.41) and reduced subsequent HIV infection of the cells. The specification provides no evidence for the use of siRNAs to cure HIV infection in an individual. Currently, the state of the art indicates that curing HIV has yet to be achieved. For example, a recent review article summarizes the state of HIV prevention as follows: "Ultimate control of the HIV epidemic will require prevention of new infections, and as the global epidemic continues to expand, there has never been a greater need for an effective vaccine. Developing an effective AIDS vaccine that prevents infection may not be feasible, so current vaccine strategies are focused on protection from disease progression," (Deeks, S.G. and B.D. Walker, *Immunity*, v.27:406-16, 2007, of record). Thus, Applicant's claims to treating HIV are not enabled.
